### COMP47390 Assignment 4 TweeterTags Test

Oisín Byrne 13437368

- Within My TweetTVC ViewController I added a didSet to the private variable storing the list of tweets. This didSet reloads the tableview, redisplaying visible rows. If a new set of tweets were added, they would update the tableview
- Similarly, the twitterQueryText variable has a didSet to update the relevant level, clear the tweets variable and reload the tableview data again
- TweetTVCell represents each cell generated by the tableview. When retrieving the profile picture image for each tweet it first accesses the profileImageUrl from the Twitter API, then it converts it to type Data before converting it to a UIImage
- The date formatter uses long style if the time interval since the tweet has been more than a day, otherwise it uses the short style
